## INDIVIDUAL TEST <br> S.-T YAU COLLEGE MATH CONTESTS 2012

## Algebra and Number Theory <br> Please solve 5 out of the following 6 problems,

 or highest scores of 5 problems will be counted.1. Prove that the polynomial $x^{6}+30 x^{5}-15 x^{3}+6 x-120$ cannot be written as a product of two polynomials of rational coefficients and positive degrees.
2. Let $\mathbb{F}_{p}$ be the field of $p$-elements and $G L_{n}\left(\mathbb{F}_{p}\right)$ the group of invertible $n$ by $n$ matrices.
(1) Compute the order of $G L_{n}\left(\mathbb{F}_{p}\right)$.
(2) Find a Sylow p-subgroup of $G L_{n}\left(\mathbb{F}_{p}\right)$.
(3) Compute the number of Sylow p-subgroups.
3. Let $V$ be a finite dimensional vector space over complex field $\mathbb{C}$ with a nondegenerate symmetric bilinear form (, ). Let

$$
O(V)=\{g \in G L(V) \mid(g u, g v)=(u, v), u, v \in V\}
$$

be the orthogonal group. Prove that fixed point subspace $\left(V \otimes_{\mathbb{C}} V\right)^{O(n)}$ is 1 -dimensional.
4. Let $\mathfrak{D}$ be the ring consisting of all linear differential operators of finite order on $\mathbb{R}$ with polynomial coefficients, of the form

$$
D=\sum_{i=0}^{n} a_{i}(x) \frac{d^{i}}{d x^{i}}
$$

for some natural number $n \in \mathbb{N}$ and polynomials $a_{0}(x), \cdots, a_{n}(x) \in$ $\mathbb{R}[x]$. This ring $R$ operates naturally on $M:=\mathbb{R}[x]$, making $M$ a left $\mathfrak{D}$-module.
(1) (to warm up) Suppose that $b(x) \in \mathbb{R}[x]$ is a non-zero polynomial in $M$, and let $c(x)$ be any element in $M$. Show that there is an element $D \in \mathfrak{D}$ such that $D(b(x))=c(x)$.
(2) Suppose that $m$ is a positive integer, $b_{1}(x), \cdots, b_{m}(x)$ are $m$ polynomials in $M$ linearly independent over $\mathbb{R}$ and $c_{1}(x), \cdots, c_{m}(x)$ are $m$ polynomials in $M$. Prove that there exists an element $D \in \mathfrak{D}$ such that $D\left(b_{i}(x)\right)=c_{i}(x)$ for $i=1, \cdots, m$.
5. Let $\Lambda$ be a lattice of $\mathbb{C}$, i.e., a subgroup generated by two $\mathbb{R}$-linear independent elements. Let $R$ be the subring of $\mathbb{C}$ consists of elements $\alpha$ such that $\alpha \Lambda \subset \Lambda$. Let $R^{\times}$denote the group of invertible elements in $R$.
(1) Show that either $R=\mathbb{Z}$ or have rank 2 over $\mathbb{Z}$.
(2) Let $n \geq 3$ be a positive integer and $(R / n R)^{\times}$the group of invertible elements in the quotient $R / n R$. Show that the canonical group homomorphism

$$
R^{\times} \rightarrow(R / n R)^{\times}
$$

is injective.
(3) Find maximal size of $R^{\times}$.
6. Let $V$ be a (possible) infinite dimensional vector space over $\mathbb{R}$ with a positive definite quadratic norm $\|\cdot\|$. Let $A$ be an additive subgroup of $V$ with following properties:
(1) $A / 2 A$ is finite;
(2) for any real number $c$ the set

$$
\{a \in A: \quad\|a\|<c\}
$$

is finite.
Prove that $A$ is of finite rank over $\mathbb{Z}$.
